

Keep the exact target
 $U(\mathbf{Q}) = Y$

Do not forget Y too early

Extract modified-metric decay
 $m(Y) \leq \sum_i m(Q_i)$

Geometry before enlargement

Mark an active root
 $r \in \text{skel}(Y)$

Target-sensitive order bound
 $T_n(Y) \leq M e^{-\rho m(Y)} (4M^2)^n$

Rooted tree-profile closure
 $\frac{n+1}{(n+1)!} \sum_T \prod_v c_T(v)! \leq 4^n$

Parent-normalized
leaf recursion
 $\sum K_j(Q, Q') \leq j! M^{j+1} m(Q)$
